I would like to talk about an electric scooter that I've bought a couple of months ago. I bought it because I needed a way to commute other than the public buses and taxis, as they often get stuck in the traffic, and they're incredibly uncomfortable to ride on during rush hours.

The scooter is from Gororo, a domestic brand that used to make traditional gasoline-powered motorcycle, but recently, they switched to electric scooters as it's a tough market for gasoline scooters to survive because of the competition and it's greener for the environment.

The overall design of the scooter is quite futuristic, as the body was being painted red and there were a lot of metal grilles on the side of the scooter with a carbon fiber casing covering the engine parts giving it a more sportier look.

The battery life of the scooter is quite long and although I've never calculated how far it could run....I've ridden it for the whole day with my friend riding on the backseat without the scooter running out of battery.

The lighting of the scooter is quite futuristic, with a lot of modern elements like a daytime running led lights and all the needles and numbers on the dashboard has been replaced by a small LCD screen which illuminates in the dark so it's really handy for night riders. Every speculation that you find on the scooter is very similar to those you can find on a luxury German sedan.

What's more, the scooter is quite user-friendly, with a waterproof USB charger that you can plug into while you ride on the streets. You can charge all kinds of electronics that comes with a USB plug-in like your cell phone, e-book or your mp3 player,

Finally, it's a great scooter that I've bought, It's got the looks and it does its job. A full star on customer experience.
